

What is claimed is:

- 1 1. A method for simulating hardware circuits during which voltages are
2 calculated at a plurality of circuit nodes, comprising the steps of:
3 (a) carrying out a first DC-simulation run at the begin of a functional
4 cycle,
5 (b) carrying out a second DC-simulation run at the end of said cycle,
6 (c) comparing simulated values from both runs at respective circuit
7 nodes, and
8 (d) storing mismatch information about static error afflicted nodes at
9 which the calculated values differ by more than a predetermined
10 first threshold value.
- 1 2. The method according to claim 1 further comprising the steps of:
2 (e) putting out said mismatch information for a manual correction,
3 (f) carrying out a transient analysis covering the same functional cycle
4 after correction,
5 (g) comparing calculated values from said analysis with calculated
6 values from said first or second DC simulation run at respective
7 circuit nodes, and
8 (h) storing mismatch information about dynamic error afflicted nodes at
9 which the calculated values differ by more than a predetermined
10 second threshold value.
- 1 3. The method according to claim 2 further comprising the step of
2 automatically correcting dynamic errors in a simulation input file.
- 1 4. The method according to 3 claim further comprising the step of performing
2 an iterative hardware simulation with the corrected simulation input file.

- 1 5. The method according to claim 1 comprising the step of setting the
2 START TIME prior to the begin of a functional cycle.
- 1 6. The method according to claim 1 in which the hardware is built according
2 to silicon-on insulator (SOI) technology.
- 1 7. A computer system having installed program means comprising program
2 code portions for performing the steps:
3 (a) carrying out a first DC-simulation run at the begin of a functional
4 cycle,
5 (b) carrying out a second DC-simulation run at the end of said cycle,
6 (c) comparing simulated values from both runs at respective circuit
7 nodes, and
8 (d) storing mismatch information about static error afflicted nodes at
9 which the calculated values differ by more than a predetermined
10 first threshold value.
- 1 8. The computer system according to claim 7 further comprising program
2 code portions for performing the steps:
3 (e) putting out said mismatch information for a manual correction,
4 (f) carrying out a transient analysis covering the same functional cycle
5 after correction,
6 (g) comparing calculated values from said analysis with calculated
7 values from said first or second DC simulation run at respective
8 circuit nodes, and
9 (h) storing mismatch information about dynamic error afflicted nodes at
10 which the calculated values differ by more than a predetermined
11 second threshold value.

- 1 9. A hardware testing computer system having installed program means
2 comprising program code portions for performing the steps:
 - 3 (a) carrying out a first DC-simulation run at the begin of a functional
4 cycle,
 - 5 (b) carrying out a second DC-simulation run at the end of said cycle,
 - 6 (c) comparing simulated values from both runs at respective circuit
7 nodes, and
 - 8 (d) storing mismatch information about static error afflicted nodes at
9 which the calculated values differ by more than a predetermined
10 first threshold value.
- 1 10. The computer system according to claim 9 further comprising program
2 code portions for performing the steps:
 - 3 (e) putting out said mismatch information for a manual correction,
 - 4 (f) carrying out a transient analysis covering the same functional cycle
5 after correction,
 - 6 (g) comparing calculated values from said analysis with calculated
7 values from said first or second DC simulation run at respective
8 circuit nodes, and
 - 9 (h) storing mismatch information about dynamic error afflicted nodes at
10 which the calculated values differ by more than a predetermined
11 second threshold value.

- 1 11. Computer program comprising code portions adapted for performing the
2 steps below when said program is loaded into a computer system:
- 3 (a) carrying out a first DC-simulation run at the begin of a functional
4 cycle,
- 5 (b) carrying out a second DC-simulation run at the end of said cycle,
- 6 (c) comparing simulated values from both runs at respective circuit
7 nodes, and
- 8 (d) storing mismatch information about static error afflicted nodes at
9 which the calculated values differ by more than a predetermined
10 first threshold value.
- 1 12. The computer program according to claim 11 further comprising program
2 code portions for performing the steps:
- 3 (e) putting out said mismatch information for a manual correction,
- 4 (f) carrying out a transient analysis covering the same functional cycle
5 after correction,
- 6 (g) comparing calculated values from said analysis with calculated
7 values from said first or second DC simulation run at respective
8 circuit nodes, and
- 9 (h) storing mismatch information about dynamic error afflicted nodes at
10 which the calculated values differ by more than a predetermined
11 second threshold value.

- 1 13. Computer program product stored on a computer usable medium
2 comprising computer readable program for causing a computer to perform
3 the method comprising:
- 4 (a) carrying out a first DC-simulation run at the begin of a functional
5 cycle,
 - 6 (b) carrying out a second DC-simulation run at the end of said cycle,
 - 7 (c) comparing simulated values from both runs at respective circuit
8 nodes, and
 - 9 (d) storing mismatch information about static error afflicted nodes at
10 which the calculated values differ by more than a predetermined
11 first threshold value.
- 1 14. The computer program product according to claim 13 wherein said
2 method further comprises performing the steps:
- 3 (e) putting out said mismatch information for a manual correction,
 - 4 (f) carrying out a transient analysis covering the same functional cycle
5 after correction,
 - 6 (g) comparing calculated values from said analysis with calculated
7 values from said first or second DC simulation run at respective
8 circuit nodes, and
 - 9 (h) storing mismatch information about dynamic error afflicted nodes at
10 which the calculated values differ by more than a predetermined
11 second threshold value.
